QUICK FIX GUIDE 3

DOES YOUR CANISTER FILTER HAVE LOW FLOW?

Troubleshoot your canister filter with these 5 quick checks.

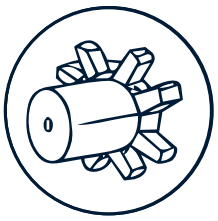

1

CHECK THE FILTER MEDIA

Dirty or clogged media can restrict water flow. Rinse or replace if necessary and make sure it's not packed too tightly.

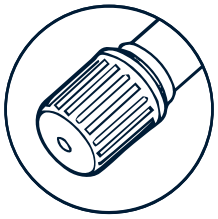

2

CHECK THE IMPELLER

Debris or wear can reduce impeller performance. Remove and clean the impeller and impeller chamber thoroughly.

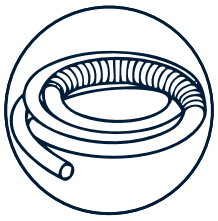

3

CHECK THE INLET STRAINER

A dirty or blocked inlet strainer restricts water entering the filter. Clean it regularly to maintain optimal flow.

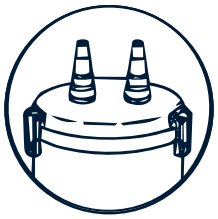

4

CHECK THE HOSES

Kinks, blockages or algae build-up in the hoses can reduce flow. Straighten, clean or replace hoses if needed.

5

CHECK FOR AIR LEAKS

Air leaks in hoses or connections can reduce flow. Ensure all seals and connections are tight, secure and not damaged.
