QUICK FIX GUIDE 9

IS YOUR CANISTER FILTER FLOW REDUCED?

Troubleshoot your canister filter with these 5 quick checks.

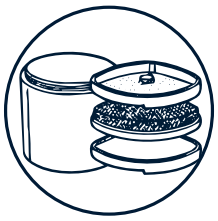

1

CHECK THE INLET STRAINER

A dirty or clogged inlet strainer can restrict water flow. Remove and clean it to ensure water can enter the filter freely.

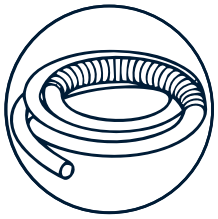

2

CHECK THE FILTER MEDIA

Dirty or clogged media can restrict water flow. Rinse or replace the media if needed and ensure it's not packed too tightly.

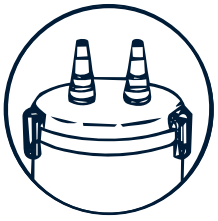

3

CHECK HOSE CONNECTIONS

Ensure all hose connections are tight, secure and not kinked or blocked. Leaks or kinks can reduce flow.

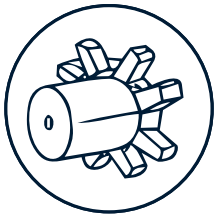

4

CHECK THE PRIMER

A partially closed or air-locked primer can reduce flow. Open the primer fully (if fitted) and pump until water flows freely.

5

CHECK THE IMPELLER

Debris or wear can reduce impeller performance. Remove and clean the impeller and chamber to restore optimal flow.
